Secretary Miss H. Stowe, Micropalaeontology Unit, University College, Gower Street, London WC1E 6BT. Tel: 01-387 7050.

Instructions to Authors

Contributions illustrated by scanning electron micrographs of Ostracoda in stereo-pairs are invited. Format should follow the style set by the majority of papers in this issue. Descriptive matter apart from illustrations should be cut to a minimum; preferably each plate should be accompanied by one page of text only. Blanks to aid in mounting figures for plates may be obtained from any one of the Editors or Editorial Board. Completed papers should be sent to Dr David J. Siveter.

The front cover shows a right valve $(927 \,\mu m \log)$ of *Newnhamia petiola* De Deckker, 1979, in life position; from the type locality, Pine Tree Creek Lagoon, near Hughenden, Queensland, Australia. This species swims upside down and can stick to the water surface tension with its flat ventral area.

ON EUCYTHERE DECLIVIS (NORMAN)

by David J. Horne & John E. Whittaker (City of London Polytechnic & British Museum (Natural History), London)

Genus EUCYTHERE Brady, 1868

Cytheropsis gen. nov. G. O. Sars, Forh. VidenskSelsk. Krist., 1865, 57–58 (= junior homonym of Cytheropsis M'Coy, 1849).
 Eucythere nom. nov. G. S. Brady, Trans. Linn. Soc. Lond., 26, 429.

Type-species: Cythere declivis Norman, 1865 (subsequent designation by Brady & Norman, Scient. Trans. R. Dubl. Soc., ser. 2, 4, 178, 1889)

Diagnosis: Carapace sub-triangular in lateral view with greatest height at or in front of mid-length. Anterior margin broadly rounded, dorsal and ventral margins strongly convergent posteriorly. Greatest width at or behind mid-length. External surface smooth or weakly ornamented. Inner lamella broad anteriorly, narrow ventrally and posteriorly. Anterior and posterior vestibula present. Marginal pore-canals straight, usually 10–15 anteriorly and about 3 posteriorly. Hinge lophodont, running from about mid-length to the posterior margin. Four adductor muscle-scars in an arcuate row, the lowermost being relatively large and crescent-shaped. Frontal scar relatively large, asymmetrically U- or V-shaped. Prominent fulcral point. Normal pores conspicuous, sieve-type. Dimorphic, male more elongate than female. Antennula with five articulated podomeres. Maxillular palp and masticatory processes slender, innermost one much reduced. Legs slender. Male brush-shaped organ relatively large, spatulate, with numerous distal setae. Male copulatory appendage relatively small.

Lucythere declivits (2 of 6)

Stereo-Atlas of Ostracod Shells 12, 4

I ueviliere declivis (4 of 6)

Eucythere declivis (5 of 6)

Figured specimens: (contd.)

s: 1984.196, both from the North Sea off Aberdeen (approx. lat. 57°N, long. 00°) were provided by
J. E. Robinson. Hancock Mus. no. 1.13.33, from 8 miles off the Durham Coast between Seaham and Sunderland (approx. lat. 54°55′N, long. 01°10′W), depth 20–30 fath. (36–55m), was taken from slide no. 2.11.36 in the Brady collection.

Diagnosis:

Remarks:

 Carapace finely pitted in dorsal and median areas, smooth or with faint concentric ribbing in anterior and ventral areas. Posteroventral marginal area strongly compressed in male, weakly so in female. Anterior vestibulum relatively broad. Distal process of male copulatory appendage relatively large, semicircular.

In his "Monograph of the Recent British Ostracoda" Brady (1868, *op. cit.*) recognised two forms in addition to the true *E. declivis*. One of these he described as *E. anglica* sp. nov. in the appendix of the monograph, while the other was later described by Brady & Robertson (*Ann. Mag. nat. Hist.*, ser. 4, **3**, 370–371, pl. 21, figs. 12–14, 1869) as *E. declivis* var. *prava*; both taxa have been largely ignored by subsequent authors. Our examination of their respective type specimens in the Hancock Museum has shown conclusively that they are both valid species (see Horne & Whittaker, *Stereo-Atlas of Ostracod Shells* **12**, 7–10 and **12**, 11–14, 1985). *E. anglica* is less elongate and more strongly pitted than *E. declivis*, while *E. prava* is easily distinguished by its posteromedian sulcus. The type slides of *E. declivis* in the Norman collection contain specimens of both *E. declivis* and *E. prava*. We have chosen as a lectotype and paralectotype two specimens which correspond closely to the original description and illustrations of *E. declivis*.

The Mediterranean records of *E. declivis* of G. W. Müller (1894, *op. cit.*) and most subsequent authors may be referred to *Eucythere curta* Ruggieri, 1975 (*Revta esp. Micropaleont.*, **6**, 433–434, fig. 6; *q.v.* for full synonymy). As far as we can ascertain *E. declivis* does not live in the Mediterranean.

The form illustrated by Sars (1925, *op. cit.*) appears to lack the posteroventral compressed area exhibited by British specimens and also differs in minor details of carapace outline and the male copulatory appendage; we are therefore in some doubt as to whether it is conspecific with *E. declivis.* Of Wagner's (1957, *op. cit.*) illustrations of *E. declivis*, only one can be confidently assigned to that species, while the others should be referred to *E. argus* (Sars, 1866).

Distribution: Records of *E. declivis* require careful re-examination in the light of the above-mentioned confusion with other species. It appears to be fairly common in marine sublittoral waters around Britain and in the North Sea. Rosenfeld (1977, *op. cit.*) recorded it in the Baltic Sea in salinities of $25-30\%_0$.

Whittaker (City of London Polytechnic & British Museum (Natural History), London) Eucythere anglica Brady, 1868 1868 Eucythere declivis (Norman); G. S. Brady, Trans. Linn. Soc. Lond., 26, (pars), 431, pl. 25, figs. 49, 50 only (non 430, pl. 27, figs. 22-26, 52-55) (non Cythere declivis Norman, 1865). 1868 Eucythere anglica sp.nov. G. S. Brady, Trans.Linn.Soc.Lond., 26, 475, pl. 25, figs. 49, 50. Lectotype: Hancock Museum, University of Newcastle, no. 1.54.20, 9 RV. [Paralectotype: Hancock Museum no. 1.54.21, & RV]. Type locality: Off Seaham, Durham coast, NE England (approx. lat. 54° 50'N, long. 01° 10'W); Recent. Hancock Mus. nos. 1.54.20 (lectotype, 9 RV: Pl. 12, 8, fig. 2), 1.54.21 (paralectotype, & RV: Pl. 12, Figured specimens: 8, fig. 1, Pl. 12, 10, fig. 3), 1.54.22 (9 car. + appendages; LV: Pl. 12, 8, fig. 3, Pl. 12, 10, fig. 1, Text-fig. 1b; RV: Pl. 12, 10, figs. 2, 4, Text-fig. 1a; appendages: Text-fig. 1c-d). Nos. 1.54.20 and 1.54.21 were taken from slide no. 1.02.35 in the Brady collection, labelled "Eucythere anglica, off Seaham". 1.54.22 is from off Hartlepool, NE England (approx. lat. 54° 41'N, long. 01° 08'W) and was taken from slide no. 2.13.04 in the Brady collection. Carapace small ($\leq 500 \,\mu m$ long), conspicuously pitted in median and dorso-median areas, with Diagnosis: concentric ribbing in the anterior and ventral marginal areas. Posteroventral corner somewhat compressed. Anterior vestibulum relatively broad. Brady (1868, op.cit.) initially mentioned and illustrated this species as a form of E. declivis, but then Remarks: described it as a new species in the appendix of the same publication. It is smaller, less elongate and more strongly pitted than E. declivis (see Horne & Whittaker, Stereo-Atlas of Ostracod Shells 12, 1-6, 1985). Explanation of Plate 12, 8 Fig. 1, *d* RV, ext.lat. (paralectotype, **1.54.21**, 460 µm long); fig. 2, *P* RV, ext.lat. (lectotype, **1.54.20**, 480 µm long); fig. 3, *P* LV, ext.lat. (1.54.22, 480μ m long). Scale A (100 μ m; ×125), figs. 1-3. Stereo-Atlas of Ostracod Shells 12, 9 *Eucythere anglica* (3 of 4) The Brady collection contains several examples of this species from marine sublittoral localities Distribution: around the British Isles. The absence of more recent records is probably due to confusion with E.declivis. 00μι 100 µm Text-fig. 1, 9 valves + appendages, 1.54.22; a-b: RV & LV drawn in transmitted light; c: antennula; d: antenna. 1868 Eucythere declivis (Norman); G. S. Brady, Trans.Linn.Soc.Lond., 26, 430 (pars), pl. 27, figs. 52-53 only (non pl. 27, figs. 22-26, 54-55, pl. 25, figs. 49-50) (non Cythere declivis Norman, 1865).

1869 Eucythere declivis var prava; G. S. Brady & D. Robertson, Ann. Mag. nat. Hist., (ser. 4), 3, 370-371, pl. 21, figs. 12-14.

Lectotype: Hancock Museum, University of Newcastle, no. 1.39.33, 9 carapace.

Type locality:Westport Bay (= Clew Bay), Co. Mayo, W Ireland (approx. lat. $53^{\circ} 50'$ N, long. $09^{\circ} 40'$ W); Recent.Figured specimens:Hancock Mus. nos. 1.39.33 (lectotype, \Im car.: Pl. 12, 12, fig. 1), 1.39.34 (\Im car + appendages; LV:
Pl. 12, 12, fig. 3, Text-fig. 1a; RV: Pl. 12, 14, fig. 2; copulatory appendages: Text-fig. 1c-d), 1.39.35
(\Im car. + appendages; appendages: Text-fig. 1e-f). Brit. Mus. (Nat.Hist.) no. 1984.187 (\Im car.; LV:
Pl. 12, 12, fig. 2, Pl. 12, 14, figs. 1, 4, Text-fig. 1b; RV: Pl. 12, 14, fig. 3). The lectotype was taken
from slide no. 2.03.16 in the Brady collection. Hancock Mus. nos. 1.39.34 and 1.39.35, from off
St. Mary's, Isles of Scilly (approx. lat. $49^{\circ} 55'$ N, long. $06^{\circ} 15'$ W), depth 20 fath. (36m), were taken
from slide no. 2.12.40 in the Brady collection. Brit.Mus. (Nat.Hist.) no. 1984.187, from the English
Channel, S of the Eddystone Lighthouse (approx. lat. $50^{\circ} 02'$ N, long. $04^{\circ} 22'$ W), depth approx.
75m, was provided by S. Sturrock.

Diagnosis: Posterior half of carapace with an irregular longitudinal posteromedian sulcus, anterior half faintly reticulate. Surface smooth or very finely pitted. Anterior vestibulum relatively narrow. Male copulatory appendage with a lemon-shaped distal process.

Remarks: Brady (1868, op.cit.) originally mentioned and illustrated this species as a form of *E.declivis* (Norman, 1865) (see Horne & Whittaker, Stereo-Atlas of Ostracod Shells 12, 1-6, 1985); it was later

Stereo-Atlas of Ostracod Shells 12, 17

Piretia commasulcata (3 of 4)

Diagnosis:	Species of Piretia with short, comma-shaped sulcus near the dorsal margin. Preadductorial node
	bulb-like but flattish. Shape ('Gestalt') rather long to long; shape of domicilium very long. A narrow,
	low, ridge-like plica occurs along the dorsal border. Velum forms a ridge or narrow flange which
	terminates posteroventrally in a short spine. Female has a very strongly convex dolon forming a false
	brood pouch. A ridge occurs along the border of lateral and ventral surfaces of the pouch. Lateral
	surface reticulate. Adults about 0.8 mm long.

Remarks: P. commasulcata is distinguished from congeneric species mainly by its elongate shape and its diagnostic short, comma-shaped sulcus. Piretia erinacea Schallreuter, 1964 (lower Upper Viruan Backsteinkalk erratic boulders of Northern Germany) differs further in having a row of short spines instead of a ridge at the border of the lateral and ventral surfaces of the female dolon, its tecnomorphic velum is developed as a spinose ridge or a row of spines and its surface is spinose and granulose (Schallreuter, Palaeontographica (A), 144, pl. 18, fig. 1, pl. 17, figs. 5-7, 1973).

Piretia reticulata Qvale, 1980 (*Norsk Geol. Tidsskr.*, **60**, 94), from the Caradoc Series of the Oslo region, resembles *P. commasulcata* in having reticulation and a velar flange with an abrupt posterior termination but is distinguished by its much better developed sulcus, its centrodorsal spine and by its tecnomorphic velum which consists of a row of spines recalling that of *P. erinacea* (Qvale, *op. cit.*, figs. 2, 3).

Distribution: Known from the type locality and from Öjlemyrflint erratic boulders of the Isle of Gotland, Baltic Sea (boulder no. G30 of Schallreuter collection).

Explanation of Plate 12, 18

Kroemmelbeinia valensis (1 of 4)

ON KROEMMELBEINIA VALENSIS SCHALLREUTER sp. nov.

by Roger E. L. Schallreuter (University of Hamburg, German Federal Republic)

Kroemmelbeinia valensis sp. nov.

Holotype: Geologisch-Paläontologisches Institut und Museum, University of Hamburg (GPIMH) no. 2943; a carapace.

[Paratypes: nos. **2944–2947**]. Upper Harjuan (upper Ordovician) Öjlemyrflint erratic boulder no. G287 from the beach at Vale,

Type locality:

NE Gotland (Baltic Sea), Sweden; lat. 57°48'N, long. 18°26'E. After the type locality, Vale, Gotland.

Derivation of name: Figured specimens:

GPIMH nos. **2944** (paratype, LV: Pl. **12**, 20, fig. 1), **2945** (paratype, RV: Pl. **12**, 20, fig. 2), **2943** (holotype, car.: Pl. **12**, 22, fig. 1) and **2946** (paratype, LV: Pl. **12**, 22, fig. 2). All specimens are from the type locality; boulder collected by the author in 1976.

Explanation of Plate 12, 20

Fig. 1, LV, ext. lat. (paratype, **GPIMH 2944**, 1505 μ m long); fig. 2, RV, ext. lat. (paratype, **GPIMH 2945**, 1805 μ m long). Scale A (250 μ m; ×67), fig. 1; scale B (250 μ m; ×55), fig. 2.

Stereo-Atlas of Ostracod Shells 12, 21

Diagnosis: Remarks: Species of *Kroemmelbeinia* with the 'anteroventral corner' situated near the longitudinal middle line and only weakly pointed. Posteroventral corner pointed but not spinose. Adults up to 2.00 mm long.

The middle Ordovician type-species, *Kroemmelbeinia ala* Schallreuter (*Geologie* 18, 211, 1969) (= *Beecherellita ordovica* Neckaja, 1973; Schallreuter, *Geol. För Stockh. Förh.* 97, 387, 1975), has the same shape (length : height ratio) but is much smaller (adults 0.82 mm long). Moreover, the anteroventral corner in *K. ala* is more pointed and lies more ventrally than in *K. valensis*, and its posteroventral corner forms a short spine whereas in *K. valensis* it is only pointed.

K. valensis clearly displays two stop-pegs in the larger valve (Pl. 12, 22, fig. 2). In the last decade this feature has proved to be very important in the higher taxonomy of Ordovician podocopes. It is characteristic for Ordovician metacopes (e.g., see *Stereo-Atlas Ostracod Shells* 5, 56, fig. 1; 7, 76, fig. 2; 7, 80, figs. 1–2; Schallreuter, *Proc. VII Internat. Symp. Ostracodes Belgrade* 1979, pl. 1, figs. 2, 6, 8, 9, pl. 2, fig. 5), and is taxonomically more important than the general outline and other features. Thus, it has helped unmask excellent examples of homeomorphy in ostracodes; for example, *Kroemmelbeinia spina* Schallreuter, 1969 has a distinct inner lamella but lacks stoppegs and was therefore later placed in *Spinobairdia*. A second example involves '*Platyrhomboides' minimus* (with broad inner lamella) and 'P.' *breviclaustrum* (with two stop-pegs) (Schallreuter, 1979, *op. cit.*, pl. 1, figs. 7, 8 and pl. 2, figs. 3, 4).

Distribution: Known only from the type locality; upper Ordovician.

Glyptocythere raasayensis (1 of 8)

ON GLYPTOCYTHERE RAASAYENSIS STEVENS sp. nov.

by Graham W. Stevens (University of Hull, England)

Glyptocythere raasayensis sp. nov.

Holotype: University of Hull no. HU.212. J.1, a \Im carapace. [Paratypes: nos. HU.212. J.2-6].

Type locality: Stream section at Brae (Nat. Grid. Ref.: NG 515418), Isle of Raasay, Scotland. Garantiana Clay, *garantiana* Zone, Bajocian, Jurassic. *ation of name:* From the type locality, Isle of Raasay.

Derivation of name: Figured specimens:

University of Hull, nos. HU.212. J.1 (holotype, \Im car.: Pl. 12, 24, fig. 1, Pl. 12, 26, fig. 1), HU.212. J.2 (\Im RV: Pl. 12, 24, fig. 2, Pl. 12, 28, fig. 1; specimen broken subsequent to photography), HU.212. J.3 (\Im car.: Pl. 12, 26, fig. 2), HU.212. J.4 (\Im LV: Pl. 12, 28, fig. 2, Pl. 12, 30, fig. 2), HU.212. J.5 (\Im LV:

Pl. 12, 30, fig. 1). All the specimens are from the type locality and horizon. *Diagnosis:* A species of *Glyptocythere* in which the carapace shows well developed reticulation formed by fine anastomosing ribs over most of the lateral surface. The postero-dorsal, dorsal and antero-dorsal marginal areas are smooth and there are prominent pore conuli in the postero-dorsal area. Five prominent longitudinal ribs are developed ventrally. Sexual dimorphism distinct, the presumed females being proportionally higher and wider than the males. Hinge and muscle scar pattern typical of the genus.

Explanation of Plate 12, 24

Stereo-Atlas of Ostracod Shells 12, 25

Glyptocythere raasayensis (3 of 8)

Whereas the early Bajocian and Bathonian ostracod faunas of Britain are well known, there is a Remarks: dearth of information on higher Bajocian faunas and so a lack of material with which the present species can be compared. However, on the continent the upper Bajocian Glyptocythere species are well known; the type-species, G.tuberodentina Brand & Malz, 1962 (Senckenberg.leth., 43, 433-435), comes from the Obere Parkinsonienschichten of NW Germany which lies above the garantiana Zone. There are clearly similarities between the present species and the type-species in the general pattern of ornamentation but in G.raasayensis the reticulation lacks the accentuation of the vertical element seen in G.tuberodentina. General shape is similar in the females, but the male G.raasayensis has a narrower caudal projection. The Scottish species also has five longitudinal ventral ribs compared with three or four in the type-species. G. regulariformis Brand & Malz, 1962 from the Garantianenschichten in Germany, of comparable age to the Scottish deposit, is much closer to the present species in the form of ornamentation but has a much more convex ventral margin. There is nothing else comparable from the garantiana Zone. The slightly earlier G.praecursor Brand & Malz, 1966 from the Subfurcatenschichten shows similar but coarser ornamentation and a more convex ventral margin. Other species are less close. Among the earlier British species G. scitula Bate, 1965 from the humphresianum Zone is closer than any of the German species and G.raasayensis could well be a later derivative. The latter differs most obviously in the better-defined postero-dorsal angle and the straight or slightly convex dorsal margin.

Explanation of Plate 12, 26

Fig. 1, \Im car., dors. (holotype, **HU.212. J.1**, 750 μ m long); fig. 2, δ car., dors. (**HU.212. J.3**, 740 μ m long). Scale A (100 μ m; ×130), figs. 1, 2.

Glyptoexthere rausavensis (2 of 8)

Glyptoeythere raasavensis (4 of 8)

Glyptocythere raasayensis (5 of 8)

Remarks (contd.):

The type locality, near Storab's Grave, is regarded by Morton (*Scott.J.Geol.*, **12**, 24, 1976) as the best in the Hebrides. Here the Garantiana Clay is approximately 2 m thick and lies directly above the Bearreraig Sandstone Formation. It consists of poorly bedded, structureless medium-grey clay which is highly fossiliferous and contains the ammonites *Garantiana* (*G.*) filicosta and *Garantiana* (*G.*) baculata as well as a large number of small bivalves including prolific Avicula. The microfauna is restricted to three foraminiferal species (Ammobaculites agglutinans, Frondicularia oolithica and Lenticulina limbata) and this single ostracod species. The ammonites and all the other fauna suggest normal marine salinities, but the pyritisation of the ammonites, the small size (less than 4 mm) of the bivalves together with their pyrite skin and the restricted nature of the microfauna suggest generally inimical conditions and perhaps somewhat deoxygenated bottom waters. The general aspect of the fauna suggests a shallow shelf sea with a depth of about 20m. So far known only from the type locality.

ON LIMNOCYTHERE SHIXIAENSIS (WANG)

by Wang Qiang

(Tianjin Institute of Geology and Mineral Resources, China)

Limnocythere shixiaensis (Wang, 1980)

1980 Leucocythere shixiaensis sp.nov. Q.Wang, Bull. Chinese Acad.geol.Sci., ser. 6, 1 (2), 127-134, pl. 1, figs. 1-5, text-fig. 2.

Tianjin Institute of Geology and Mineral Resources no. os.84.7-1, a 9 carapace. *Neotype:* Basal portion of the Xiashagou section, Yangyuan County, Hebei Province, China. Nihewan Type locality: Formation, Lower Pleistocene. Tianjin Inst. Geol. & Min. Res. nos. os.84.7-1 (neotype, 9 car.: Pl. 12, 32, figs. 1-4), os.84.7-2 Figured specimens: (plesiotype, 9 car.: Pl. 12, 34, figs. 1-4), os.84.7-3 (plesiotype, 9 car.: Pl. 12, 36, figs. 1-4), os.84.7-4 (plesiotype, 9 juv. car.: Pl. 12, 38, figs. 1-4), os.84.7-5 (plesiotype, 9 RV: Pl. 12, 32, fig. 5; Pl. 12, 34, fig. 5; Text-figs. 1a-d), os. 84.7-6 (plesiotype, 9 LV: Pl. 12, 36, fig. 5; Pl. 12, 38, fig. 5; Text-fig. 2). All the specimens are from the type locality and horizon. Diagnosis: Carapace reniform in lateral view with broadly rounded anterior margin; posterior margin more squarish. Asymmetrical ridges on both valves; a ridge follows the valve margin in the posterior area of the right valve and a wavy ridge occurs in the ventral area of the left valve. Two nodes occur dorsally, one on either side of a dorso-median sulcus, with the anterior one developing a faint ridge parallel to the antero-dorsal margin.

Stereo-Atlas of Ostracod Shells 12, 33

Limnocythere shixiaensis (3 of 8)

Remarks: Since all the original type specimens of this species have been destroyed, the specimens illustrated herein are designated as a neotype and plesiotypes. Originally this species was thought to belong to the genus *Leucocythere* (Wang 1980, *op.cit.*), but since it appears to be impossible to differentiate between *Leucocythere* and *Limnocythere* on carapace characters alone, it is now decided to place it in the latter genus. It is considered that the unusual morphological features of this species (asymmetrical valves and ridges) do not simply result from a salinity change as was originally suggested (Wang 1980, *op.cit.*). It should be mentioned that *Limnocythere inderica* Sharapova, as described by Kazmina (*Trudy Inst.Geol.Geofiz.sib.Otd.*, **264a**, 1-108, 1975), has a right valve with a peripheral ridge and a left valve with a ventral ridge, or vice versa, but unfortunately she did not illustrate the shape of the carapace. In the Danangou section in Yuxian County, Hebei Province, the author found the carapace of a species with a posterior peripheral ridge in both valves (therefore symmetrical ones), which was determined as *Leucocythere burangensis* Huang (Huang Baoren *et. al.*, 1982; *in: Series of the Scientific Expedition to the Qinghai-Xizang Plateau – Palaeontology of Xizang –* Book 4, 326-348); again the carapace was not illustrated in that book.

Distribution: Mr. Zhao Lianbi collected 125 carapaces and other single valves from the Nihewan Formation in the Nihewan-Shixia village section in 1964; the exact location remains unknown. The author collected a few similar specimens from a yellow-green silt-clay and a green-yellow silt at the type locality (Xiashagou section) in 1979. The Xiashagou section is located between Nihewan and Shixia and yielded the famous Nihewan vertebrate fauna of Middle-Upper Villafranchian age (P. T. de Chardin et al., Annls Paléont., 19, 8, fig. 2, 1930).

Stereo-Atlas of Ostracod Shells 12, 41

.....

Hiltermannicythere emaciata (3 of 6)

Carapace elongate, tapering posteriorly; posterior margin with a pointed extremity at about mid-Diagnosis: height. Reticulate ornament consists of relatively large, equal-sized, rounded and polygonal intercostal fossae, a few of which coalesce. Reticulum dominated by anterior concentric costa and three distinct longitudinal costae. Ventral and median costae linked posteriorly by oblique costa. Male carapace asymmetric; right valve compressed postero-ventrally, with ventral costa not developed posteriorly. Distal process of male copulatory appendage lamellar, subtriangular, truncated terminally.

Remarks: H.rubra (G. W. Müller, 1894), from the Mediterranean, is very similar to H.emaciata. However, *H.rubra* is more quadrate in carapace outline, more truncate posteriorly and the ventral costa is more prominent and not linked posteriorly to the median costa. The sexual dimorphism of the male right valve is strong in *H.emaciata* but only weakly developed in *H.rubra*. The distal process of the male copulatory appendage of *H.rubra* is distally pointed, while that of *H.emaciata* is relatively broader and distally truncate (this comparison is based on Elofson's (op.cit.) illustration of the male copulatory appendage of H.emaciata as well as on our single, damaged specimen). For further discussion of H.rubra see Athersuch & Horne (Stereo-Atlas of Ostracod Shells 12, 45-48, 1985).

Specimens identified as Falunia (Hiltermannicythere) emaciata from the Miocene of Turkey by Doruk (1973, unpublished Ph.D thesis, University of Leicester) correspond well to our Recent examples of the species and her material is regarded as conspecific.

Distribution: The distribution of both living and fossil species of *Hiltermannicythere* in NW Europe needs reappraisal. H.emaciata appears to live in shallow sublittoral waters around the coasts of England, Wales and Ireland. Recent Mediterranean records should probably be referred to H. rubra (G. W. Müller). H.emaciata has also been recorded from the Pleistocene of Great Britain (Brady, Crosskey & Robertson, op. cit.) and the Miocene of Turkey (Doruk, op.cit.).

ON HILTERMANNICYTHERE RUBRA (MÜLLER)

by John Athersuch & David J. Horne

(B.P. Research Centre, Sunbury-on-Thames & City of London Polytechnic)

Hiltermannicythere rubra (Müller, 1894)

- 1894 Cythereis rubra sp. nov. G. W. Müller, Fauna Flora Golf.Neapel, 21, 372, pl. 28, figs. 21, 26, pl. 31, figs. 2, 3.
- 1971 Carinocythereis sp.; P. J. Barbeito-Gonzalez, Mitt.hamb.zool.Mus.Inst., 67, 281, pl. 14, figs. 1c, 2c, 3c.
- 1976 Hiltermannicythere aff. H.rubra (Müller); G. Bonaduce, G. Ciampo & M. Masoli, Pubbl. Staz. zool. Napoli, 40 (1), (for 1975), 49,
- pl. 28, figs. 1-5.

1979 Hiltermannicythere rubra (Müller); J. Athersuch, J.nat.Hist., 13, 140, fig. 2 (13).

Type specimens: Athersuch (*Pubbl.Staz.zool.Napoli* 40 (2), 344-348, 1976) reported specimens in both sections of the G. W. Müller collection: 15 specimens at the Institut für Spezielle Zoologie und Zoologisches Museum der Humboldt Universität zu Berlin, E Germany and 13 specimens at the Zoologischen Institut, Greifswald, E Germany.

Type locality: Bay of Naples, Italy (lat. 40° 40'N, long. 14° 10'E); Recent.

Figured specimens: Brit. Mus. (Nat. Hist.) nos. **1984.186** (♀ car.; LV: Pl. **12**, 46, fig. 1; RV: Pl. **12**, 46, fig. 2), **1984.187** (♂ car.; RV: Pl. **12**, 46, fig. 3; LV: Pl. **12**, 48, figs. 1, 4; copulatory appendage: Text-fig. 1), **1984.188** (♀ car.; RV: Pl. **12**, 48, fig. 2; LV: Pl. **12**, 48, fig. 3). All collected by J. Athersuch from localities in Cyprus during November, 1973. **1984.186** and **1984.188** are from sand in a small cove just North of Cape Greco (lat. 33° 55'N, long. 34° 10'E), water depth 10 m, salinity 39.4%, temperature 21.5°C. **1984.187** was found in fine sand in Ayia Napa Harbour (lat. 34° 58'N, long. 34° 00'E), water depth 3 m, temperature 20°C.

Diagnosis: Carapace subquadrate, tapering slightly towards posterior; posterior margin truncate with ventral part bearing four distinct marginal denticles. Numerous intercostal fossae of varying size, often

Explanation of Plate 12, 46

Figs. 1, 2, \Im (1984.186, 720 μ m long): fig. 1, LV, ext. lat.; fig. 2, RV, ext. lat.; fig. 3, \Im RV, ext. lat. (1984.187, 760 μ m long). Scale A (200 μ m; ×80), figs. 1-3.

Stereo-Atlas of Ostracod Shells 12, 47

Hiltermannicythere rubra (3 of 4)

forming small clusters and frequently coalescing. Reticulum dominated by median and ventral longitudinal costae, which are not linked posteriorly or only weakly so. Seen internally, hinge line slightly below dorsal margin. Distal process of male copulatory appendage triangular, lamellar, with a curved, pointed prolongation at its anterior corner.

Remarks: H.rubra closely resembles H.emaciata (Brady, 1867) but differs in details of shape and ornament, particularly the disposition of the costae, and in the nature of the adult sexual dimorphism (see Athersuch & Horne, Stereo-Atlas of Ostracod Shells 12, 39-44, 1985). The sexual dimorphism of the right valve, conspicuous in H.emaciata, is only weakly developed in H.rubra. Furthermore, on the basis of the limited number of specimens of the two species that we have seen, it appears that in H.rubra the male is the larger dimorph, while in H.emaciata the reverse is true.

Falunia capsula Uliczny, 1969 (Hemicytheridae und Trachyleberidae (Ostracoda) aus dem Pliozän der Insel Kephallinia, Dissertation, Univ. Munich) and Cythereis rubra pontica Caraion, 1967 [Fauna Republicii Socialiste România, 4, Crustacea, pt. 10 (Ostracoda); Fam. Cytheridae (Ostracode marine și salmastricole), 1-164, Bucarest] also appear to be very similar to H.rubra but require detailed examination before they can be assigned with certainty to this species. We consider that the larger size of the specimens reported by Bonaduce et.al. (1976, op.cit.) is not a sufficient difference to preclude them from being referred to this species.

Distribution:

: Recent of the Mediterranean: Cyprus (herein), Greece (Barbeito-Gonzalez, *op.cit.*), Italy (Müller; Bonaduce *et al.*, *op.cit.*); ? Black Sea (Caraion, *op.cit.*). ?Pliocene of Greece (Uliczny, *op.cit.*). Because of the similarity of this essentially Mediterranean species to *H.emaciata*, all the records of both species require further investigation before their full geographical and stratigraphical distribution can be ascertained.

		ON BREPHOCHARIEIS COMPL by David J. Siveter (University of Leicester, Engle	and)
		Genus BREPHOCHARIEIS ger Type-species: Bevrichia complicata S	1. nov. alter 1848
Derivatio	on of name: Diagnosis :	Greek brephos, embryo + charieis, beautiful; resem Quadrilobate tallinnelline. Lobes stout, equally ele confluent with an evenly curved, rounded connectin laterovelar furrow virtually lacking. L2 short, strai reflexed dorsal part of L1. L3, L1 and, to a lesser (S1–S3) well developed, as is infravelar antral dimon from near anterior cardinal corner to below S2, con	blance of L1 + L2 to a foetus. Gender feminine evated except for depressed dorsal half of L4 ing lobe sited very close to velum in lateral view ight, slopes towards the end of the posterior extent L4 have cusps above the dorsum. Sub- rphism. Female dolon moderately wide, extend tinues posteriorly (as in tecnomorphs) as a fir
	Remarks:	The combined nature of its adventral structure, di <i>Tallinnella</i>) and lobation indicate the tallinnelline af distinguished from other, mainly middle Ordovician 1976 (<i>Palaeontographica</i> (A), 153 , 165; also R. E. <i>Tetrada, brephocharieis</i> lacks the distinctive laterow in <i>Tallinnella</i> Öpik (type-species: <i>T. dimopha</i> Öpik <i>Brephocharieis</i> is distinguished from <i>Tetrada</i> Nec 1953); see R. E. L. Schallreuter <i>Palaeontographica</i> entiated quadrilobation and connecting lobe, more present velum in both dimorphs. <i>Homeokiesowia</i> Sh	imorphism (resembling that of the type-genu finities of <i>Brephocharieis</i> . However, it is readil Baltic genera of the Tallinnellinae Schallreuter L. Schallreuter, <i>Geologie</i> , 15 , 200, 1966). Lik velar furrow (and very prominent velum) foun <i>c</i> , <i>Publ. Geol. Inst. Univ. Tartu.</i> , 50 , 24, 1937 kaja (type-species: <i>T. memorabilis</i> (Neckaja (A), 153 , 166. 1976) by its more clearly differ prominent antral dimorphism and its ventrall allreuter (<i>Stereo-Atlas of Ostracod Shells</i> , 6 , 75

Brephocharicis complicata (4 of 8)

Brephocharieis complicata (5 of 8)

- 1978 'Tallinnella' complicata (Salter, 1848); D. J. Siveter in: R. H. Bate & E. Robinson (eds.), A Stratigraphical Index of British Ostracoda, Geol. J. special issue 8, 41, 43, 45, 48, pl. 1, figs. 7, 8.
- 1979 Cerninella complicata (Salter, 1848); A. Přibyl, Sbornik Národního Musea (B), **33** (for 1977), 67–68 (pars), pl. 3, figs. 1, 2, non pl. 3, figs. 3–7, text-figs. 3 (3–5), 10 (1), 11 (4), 16 (2).

Lectotype:

Designated herein [the neotype designation of Přibyl (1966, 206) is invalid]. A left valve tecnomorph (*not* heteromorph as stated by Přibyl 1979, 143); internal and external moulds on rock pieces of British Geological Survey Museum, London, nos. **GSM 24525** and **GSM 24526** (= part and counterpart) respectively. The internal mould was figured by Jones 1855 (pl. 6, fig. 3) and Přibyl 1979 (pl. 3, fig. 1). The original of '*Beyrichia' complicata* of Jones 1855, pl. 6, fig. 4 (= a tecnomorphic right valve internal mould) is also on **GSM 24525**. From Llan Mill (see 'Type locality').

The specimens of Jones on GSM 24525 and 24526 are part of Salters 1848 syntype collection: they were considered as "lectosyntypes" by Stubblefield (*op. cit.*) and Harper (*op. cit*); furthermore, the pieces were catalogued in 1848 (Museum labels) and Jones (1855, 163, 164) acknowledges Salters' help and the use of 'Museum of Practical Geology' (= GSM) specimens.

The specimens of '*Beyrichia*' complicata of Jones 1855, pl. 6, figs. 1, 2 are wax casts of left and right valve tecnomorphs respectively, now in the British Museum (Nat. Hist.), London, no. I 6323; the original external moulds, from Llan Mill, have not been identified but the probability is that they were also taken from amongst the many external moulds on the original slabs held by the British Geological Survey. Topotype rock piece GSM 24527, containing the original of Harper 1947 (*op. cit.*, pl. 10, fig. 3 = a heteromorphic left valve internal mould), is also possibly syntype material (Stubblefield 1938). GSM 24525, 24526 and 24527 contain tens of moulds of *B. complicata*.

The original of 'Beyrichia' complicata of Jones 1855, pl. 6, fig. 5, is a small tecnomorphic left valve from Harnage, Shropshire, on British Geological Survey, London, slab no. **49449** and belongs to Harperopsis scripta (Harper, 1947); see C. R. Jones & D. J. Siveter, Stereo-Atlas of Ostracod Shells, **10**, 5–12, 1983. Museum label and catalogue information claim the original of Jones 1855 pl. 6, fig. 5, is British Museum (Nat. Hist.) no. **I 6325**, a single larval quadrilobate palaeocope also from Harnage. As Jones states (1855, 164) that the original is in the 'Museum of Practical Geology', the specimen in the British Museum is considered not to be the figured specimen.

Explanation of Plate 12, 54 Fig. 1, ⁹LV, ext. lat. (**OS 12581**; 2025μm long); figs. 2, 3, δ RV (**OS 6665**, 2180μm long): fig. 2, ext. lat.; fig. 3, ext. post.; fig. 4, ⁹RV, ext. lat. (**OS 6666**, 2050μm long). Scale A (500μm; × 26), figs. 1, 4; scale B (500μm; × 25), figs. 2, 3.

Henningsmoenia gunnari (1 of 4)

ON HENNINGSMOENIA GUNNARI (THORSLUND)

by R. J. Orr

(Queen's University of Belfast, Northern Ireland)

Genus HENNINGSMOENIA Schallreuter, 1964

1964 Henningsmoenia gen. nov.; R. E. L. Schallreuter, Ber. geol. Ges. DDR, 2, 91.

Type-species (by original designation): Winchellatia gunnari Thorslund, 1948

Diagnosis: Unisulcate Steusloffiinae with a long sigmoidal S2. Preadductorial node a low bulb or indistinct. Plica weak. Posteroventral lobe with a ridge-like crista; crista short or long. Female velum with a S-like step anterocentrally and a ridge-like torus; tecnomorphs with or without torus. Antrum botulate and dolonal. Lateral surface tuberculate or pustulate and also maybe finely reticulate.

Henningsmoenia gunnari (Thorslund, 1948)

1948 Winchellatia gunnari sp. nov. P. Thorslund Bull. geol. Instn. Univ. Upsala, 23, 368, pl. 20, figs. 2, 3.

1976 Henningsmoenia gunnari (Thorsland); R. E. L. Schallreuter, Palaeontographica (A) 153, (4/6), 199, pl. 7, figs. 1-8.

1982 Henningsmoenia gunnari (Thorsland); L. K. Gailīte, in: R. Z. Ulst, L. K. Gailīte & V. I. Yakovleva, Ordovician Latvia, 119, 124, 130, 191. Riga.

1983 Henningsmoenia gunnari (Thorsland); R. E. L. Schallreuter, Palaeontographica (A) 180, (4/6), 178, pl. 11, fig. 7 (q. v. for full synonomy).

1984 Henningsmoenia gunnari (Thorslund); R. E. L. Schallreuter, Geol. För. Stockh. Förh., 101, 95.

Holotype: Palaeontological Institute, University of Uppsala, Sweden; tecnomorphic left valve (listed as a right valve in Thorslund 1948, 373, pl. 20, fig. 2).

Type locality: Kullatorp core (depth 65.05m), Kinnekulle, Vastergotland, Sweden; approx. lat. 58° 30'N, long. 13° 25'E. Skagen Limestone (= Johvi Stage), middle Ordovician.

	ON HENNINGSMOENIA COSTA ORR sp. nov. by R. J. Orr		
	(Queen's University of Belfast, Northern Ireland)		
	Henningsmoenia costa sp. nov.		
Holotype: Type locality:	Ulster Museum, Belfast, no. K 10024 ; \Im RV. SW facing cliff, small cove about 230m SW of renovated Martello Tower, 800m SE of Portrane, Co. Dublin, Eire; approx. lat. 53° 29'N, long. 6° 06'W (Nat. Grid.: 0 257504). Bed 7, Locality CN, Lower Limestones Member, Portrane Limestone: Cautlevan, Ashgill Series, upper Ordovician		
Derivation of name: Figured specimens:	Latin <i>costa</i> , rib; referring to the prominent ridge. Ulster Museum, Belfast, nos. K 10024 (holotype, ♀ RV: Pl. 12 , 62, fig. 1), K 10025 (♀ RV: Pl. 12 , 62, fig. 2; Pl. 12 , 66, figs. 1, 3), K 10026 (♀ RV: Pl. 12 , 62, fig. 3; Pl. 12 , 66, fig. 2), K 10027 (♂ LV: Pl. 12 , 62, fig. 4; Pl. 12 , 64, fig. 5; Pl. 12 , 68, fig. 1), K 10028 (♀ LV: Pl. 12 , 62, fig. 5), K 10029 (♂ LV: Pl. 12 , 64, figs. 1, 2), K 10030 (juv. RV: Pl. 12 , 64, fig. 3), K 10031 (♂ LV: Pl. 12 , 64, fig. 4), K 10032 (tecnomorphic car.: Pl. 12 , 68, fig. 2) and K 10033 (♀ LV: Pl. 12 , 68, fig. 3). Specimen K 10026 is from Bed 9 and K 10027 and K 10031 are from Bed 22 of loc. F, SW facing cliff, about 145 m SW of type locality, Lower Limestones Member, Portrane Limestone. The other specimens are from the type locality. All the material is coarsely silicified.		
Diagnosis:	Species of <i>Henningsmoenia</i> in which the posteroventral crista continues to the anterodorsal border. Plica weak to absent. Female velum with diagnostic S-like step anterocentrally. No torus in tecnomorph, possible torus in female. Marginal sculpture: a narrow marginal ridge in right valve and a narrow admarginal ridge in left valve.

Scale A (200 μ m; ×65), figs. 1, 3, 5; scale B (100 μ m ×85), fig. 2; scale C (100 μ m; ×70), fig. 4.

Stereo-Atlas of Ostracod Shells 12, 63

Der

Henningsmoenia costa (3 of 8)

Remarks: Henningsmoenia costa is the youngest recorded species of the genus. The older species assigned to the genus display a progressive elongation of the crista on the wing-like posteroventral structure. In H. billingensis Schallreuter (Geol. För. Stockh. Förh., 106, 95, 1984), from the upper Member of the Dalby Limestone (Idavere $[C_{III}]$ Stage), only a short posterior spine is present. In the type-species, H. gunnari (Thorslund, 1948) from the Skagen Limestone (Johvi [D1] Stage; overall stratigraphic range = Idavere to Keila $[D_{II}]$ Stage), the short crista extends from the posterior spine to posterior of the sulcus (see Orr, Stereo-Atlas of Ostracod Shells, 12, 57, 1985). In H. costa this restricted crista has developed into a long ridge which extends to the anterodorsal border. On first examination this ridge might appear to be histial in position. However, a closer examination of some specimens (see Pl. 12, 64, figs. 4, 5, and Pl. 12, 68, figs. 1, 2) reveals that between the ridge and the velum there is a bend in the histial position.

> The oldest specimens of H. costa are from the lower Member of the Portrane Limestone (loc. F, bed 48) of Pirgu $[F_{1C}]$ age. Thus, there is a long stratigraphic interval between the youngest record of H. gunnari and the introduction of H. costa. In terms of its lateral morphology and stratigraphic distribution (Nabala $[F_{IA}]$ to Lower Pirgu $[F_{IC}]$ Stage) 'Ordovicia' pictis Neckaja (Trudy VNIGRI, 115, 1958) would appear to partly fill this gap. However, even though the exact nature of its female dimorphic structures are unclear, both Schallreuter (Palaeontographica, (A), 178, (1/3), 34, 1982) and Gailite (Ordovician Latvia, 120, 1982, Riga) assign the species to Sigmobolbina Henningsmoen. According to this interpretation 'O'. pictis represents an homeomorph of Henningsmoenia. H. costa is homeomorphic with other, approximately contemporaneous species such as the Baltic Naevhithis naevus Schallreuter (Stereo-Atlas of Ostracod Shells, 8, 137-140, 1981) and ? Pelecybolbina kolkaensis Gailite (In: Grigelis, A. A. (Ed.): The fauna and stratigraphy of Palaeozoic and Mesozoic of Baltic and Byelorussia, 61, 1975, Vilnius). The female of H. costa has the anteroventral step to the velum also seen in H. gunnari and N. naevus. However, N. naevus lacks the crista and torus which are indicative of Henningsmoenia.

Explanation of Plate 12, 64

Fig. 1, 2, 3 LV (K 10029, 1200 µm long); fig. 1, ext. lat.; fig. 2, ext. vent.; fig. 3, juv. RV, ext. lat. (K 10030, 620 µm long); fig. 4, 3 LV, int. vent. (K10031, 1010µm long); fig. 5, 3 LV, int. vent. detail of margin and velum (K 10027, 1200µm long). Scale A (200 μ m; × 55), figs. 1, 2; scale B (200 μ m; × 100), fig. 3; scale C (200 μ m; × 72), fig. 4; scale D (50 μ m; × 140), fig. 5.

Henningsmoenia costa (2 of 8)

Henningsmoenia costa (4 of 8)

Henningsmoenia costa (5 of 8)

Remarks (contd.): In *H. gunnari* and *H. billingensis* the distal edge of the velum is split ventrally to provide a ridge-like torus. In H. costa a clear corresponding feature is not immediately apparent, but in female specimens the distal end of the velum is much thicker than in the tecnomorphs (see especially Pl. 12, 66, fig. 1). This thickened velar border probably corresponds to a separate velum and torus, but because of the coarseness of the silicification the individual ridges have coalesced. In one specimen (Pl. 12, 68, fig. 3) three narrow contiguous ridges are visible and may represent one velar and two toric ridges.

A further difference between H. costa and H. gunnari is the nature of the contact margin. In H. gunnari the right valve has a contact list and an admarginal ridge and the left valve an inner semisulcus. By contrast in H. costa the right valve has a marginal ridge and the left valve an admarginal ridge (see Text-fig. 2). The precise contact structure present in H. billingensis is unknown.

Sigmobolbina' cuneata Abushik & Sarv (Paleontologija Drevnego Palaozoja Pribaltiki i Podolii, 107, pl. 2, figs. 6-8, 1983), from the Molodovo Stage (= Nabala Stage), may also belong to Henningsmoenia, though in this species there is no distinct crista and it more likely belongs in Naevhithis.

Distribution: See text-fig. 1. Lower Limestones Member (locs. F, C, CN), Main Limestones Member (loc. B), Upper Limestones Member (locs. B, K, A), Portrane Limestone, Portrane, Eire: Cautleyan to Lower Rawtheyan, Ashgill Series, upper Ordovician.

ON TYRRHENOCYTHERE AMNICOLA (SARS)

by Timothy R. Maness & Roger L. Kaesler (University of Kansas, Lawrence, Kansas, USA)

Genus TYRRHENOCYTHERE Ruggieri, 1955

Type-species (by original designation): Tyrrhenocythere pignattii Ruggieri, 1955 (= Cythere amnicola Sars, 1888) Tyrrhenocythere gen. nov. G. Ruggieri; J. Paleont., 29 (4), 698. 1955

- A genus of Hemicytheridea, subrectangular, subtrapezoidal, or auriform in lateral view. Eve tubercle Diagnosis: distinct. Anterior vestibule partitioned into pockets; each pocket is the base of a fan-like bundle of radial pore canals. Muscle-scar pattern consists of a row of four adductor scars, dorsomedian scar divided, ventromedian scar usually divided; lone, sometimes divided, scar located dorsomedially; oblique row of three frontal scars anterior to adductors.
- Remarks: The peculiar vestibule is the outstanding distinguishing feature of this genus. The appendages are typically hemicytherid and were well illustrated by Sars (1888).

Tyrrhenocythere amnicola (Sars, 1888)

- Cythere amnicola sp. nov. G. O. Sars, Arch. Math. Naturv., 12, 305-312, pl. 15, figs. 8-10, pl. 10. 1888
- Cythere sicula sp. nov. G. S. Brady, Trans. zool. Soc. Lond., 16, pt. 4, 198, pl. 25, figs. 1-7. 1902
- 1947 Hemicythere sicula (Brady); Z. S. Bronstein, Fauna SSSR. Rakoobraznye 2, 1. Ostracoda presnykh vod., 293, text-figs. 194-197, Moskva. AN SSSR.
- 1955 Tyrrhenocythere pignattii sp. nov. G. Ruggieri, J. Paleont., 29 (4), 698-699, text-figs. 1-5.
- Tyrrhenocythere amnicola (Sars); N. Krstić, in H. Löffler & D. Danielopol (eds.), Aspects of Ecology and Zoogeography of 1977 Recent and Fossil Ostracoda, 395-405, pl. 1, fig. 4, Junk, The Hague (q.v. for full synonymy).

ON PARANOTACYTHERE (PARANOTACYTHERE) MAGNIFICA LOMAX sp. nov.

by Allistair Lomax (University of Hull, England)

Paranotacythere (Paranotachthere) magnifica sp. nov.

University of Hull coll. no. HU.307.C.1; & carapace.

Type locality:

Holotype:

Derivation of name: Figured specimens: Bed C9A of coastal section of Speeton Clay, Speeton, E Yorkshire, England; lat. 54° 10'N, long. 0° 14' 40"W. Lower Hauterivian, lower Cretaceous. Latin *magnifica*, magnificent; in reference to its excellent ornamentation and preservation. University of Hull coll. nos. **HU.307.C.1**. (holotype, δ car.: Pl. 12, 74, fig. 1; Pl. 12, 76, fig. 2), **HU.307.C.2** (9 LV: Pl. 12, 74, fig. 2) and **HU.307.C.3** (9 LV: Pl. 12, 76, fig. 1). All specimens are

[Paratypes: University of Hull nos. HU.307.C.2, HU.307.C.3, HU.307.C.4.1-10].

Diagnosis:

from the type locality and horizon.
A species of *Paranotacythere (Paranotacythere)* with strong reticulation, a large postero-dorsal tubercle and in which the uppermost blade-like ventral rib tends to end at the anterior of the two postero-ventral tubercles or only continues between them in much reduced fashion.

Explanation of Plate 12, 74

Fig. 1, δ car., ext. lt. lat. (holotype, **HU.307.C.1**, 560 μ m long); fig. 2, \Im LV, ext. lat. (paratype, **HU.307.C.2**, 530 μ m long). Scale A (100 μ m; ×162), fig. 1; scale B (100 μ m; ×181), fig. 2.

Stereo-Atlas of Ostracod Shells 12, 75

Paranotacythere magnifica (3 of 4)

Remarks: The lower Hauterivian Paranotacythere (P.) magnifica differs from the upper Hauterivian P. costata (Kaye) in the absence of thick and rounded ventral ribbing. P. costata also has a much less prominent dorsal tubercle and reduced reticulation compared with P. magnifica. P. ramulosa (Sharapova), which is first found in Bed C3, upper Hauterivian at Speeton, differs only in having two large tubercles in the anteroventral region which replace the uppermost ventral rib. This suggests that P. ramulosa is related to P. magnifica and is probably derived from it by loss of the ventral rib and addition of the two anteroventral tubercles.

Distribution: P.(P.) magnifica is rare and has so far only been obtained from Bed C9A in the Speeton Clay of the coastal section, E Yorkshire, England. Over two dozen specimens have been recovered. The lithology is a dark grey, sideritic clay and common ostracod associates include Schuleridea punctatula (Roemer), Protocythere triplicata (Roemer), Protocythere hechti Triebel and Acrocythere hauteriviana (Bartenstein).
